

What is a Cochlear Implant?

A cochlear implant is an electronic device that can restore hearing for people with significant hearing loss. People who have never heard before experience hearing for the very first time.

Using state-of-the-art technology, a cochlear implant bypasses the damaged portion of the inner ear to provide a new pathway for hearing. Cochlear implants are currently the only medical technology able to functionally restore one of the five senses, which is why many physicians refer to them as "technological miracles."
